Signals

```
% The original signals  
sig1 = Amp1*sin(2*pi*lambda1*t + phi1);  
sig2 = Amp2*sin(2*pi*lambda2*t + phi2);  
  
% FFTs of those signals

```
% Comment on plot of these: These have peaks at -f0 and +f0 of each
signal
% which is understandable because the FFTs of sin waves have the form
%  $(A/2) * (\text{dirac}(f + f_0) + \text{dirac}(f - f_0))$ . Also this is not affected by
the
% initial phases because it concerns only the frequency domain.

% Now we shift the signals

% Comment: The effect of these shifts is that the magnitude of FFT
will
% stay unchanged while the phase of FFT will be changed. The more the
% delay, the less the phase plot is spread with regards to frequency.
